

FREQUENCY SHIFT / JULY 2026

FREQUENCY SHIFT

Your plain-English guide to managing the website

You describe what visitors should see. Codex handles the code, checks, GitHub, and publishing.

THE ONLY RULE TO REMEMBER

You do not need to know the technical name for anything. Describe the page, what you can see, and what you want to be different.

Prepared for new Frequency Shift website editors. No coding experience required.

Four things to know

Everything else in this guide is just a way to make these four ideas easier.

1

Talk normally

Write to Codex like you would message a person helping with the site.

2

Name what you see

Use the page name, nearby words, or a screenshot. No coding terms needed.

3

Say preview or live

Ask to see it first, or tell Codex to make the finished change live.

4

Wait for verification

A change is live only after Codex checks the real public page.

What Codex is doing for you

- Finding the right part of the website.
- Turning your description into an accurate design or content change.
- Checking phones and computers.
- Protecting changes other people are making.
- Saving the work in GitHub.
- Publishing the matching version and checking the public site.

YOU ARE STILL IN CONTROL

Codex will pause when a real decision is yours: unclear wording, an unconfirmed event fact, deleting a large area, changing a ticket link, or making a major design shift.

Your first session

Open the Frequency Shift project in Codex. The project will recognize that this computer is new.

1. Accept the client assistant

Codex will ask whether you want to enable the Frequency Shift website assistant. Say yes. Codex may show a normal approval window because it is adding the project tools to your Codex app.

2. Start one new task

After installation, start a new Codex task inside the same repository. This gives the assistant a clean start with all five Frequency Shift skills loaded.

3. Try a harmless first request

COPY AND PASTE

Show me the current website structure in plain English. Do not change or publish anything.

4. Then make a real request

COPY AND PASTE

On the home page, I want to change [what I can see] so it [desired result]. Show me before publishing.

If Codex asks for access: read the short reason in the approval window. Approve normal website work you requested. Stop and ask Matia if it mentions ownership, billing, domains, passwords, or deleting a large amount of work.

How to describe a change

A useful request needs a location, a visible target, the result you want, and whether it should go live.

THE SIMPLE FORMULA

On [page], change [thing I can see] so it [desired result]. Use [new words, image, or link]. [Show me first / make it live].

Good examples

- "On the Events page, make the next event easier to notice and make it live."
- "The large poster on the event page is cropped too tightly on my phone. Keep the whole poster visible and show me first."
- "Replace the ticket link for The Experiment with this URL. Make it live."
- "The home page feels crowded below the main photo. Make that area calmer without losing any information."
- "Add this event using the details below. If an important fact is missing, ask me one question at a time."

If you do not know where it is

STILL A VALID REQUEST

I do not know what it is called. It is the pink button beside the September event. I want it to be easier to notice.

A screenshot is often the fastest way to point. Circle the area if you want. Codex can inspect the page and find the matching source.

Words you can use

Codex translates visual language internally. You never need to say padding, flex, div, card, component, or stylesheet.

What you say	What Codex will inspect
More breathing room	Nearby spacing, line height, and how crowded the area feels
Less boxy	Borders, panels, hard edges, and repeated containers
Make it pop	Visual importance, contrast, size, and surrounding quiet
Cleaner	Competing elements, alignment, repetition, and reading order
Too zoomed	Image crop, focal point, shape, and phone behavior
Move it up	The natural page flow and the space around the item
More underground	Dark atmosphere, restraint, photography, and less corporate framing

WHEN YOU ARE UNSURE

Say: I know how I want it to feel, but I do not know the design words. Give me two or three clear options.

Codex should explain those options by what visitors will notice, not by code.

Preview, save, or make it live

These phrases tell Codex how far to take the change.

SHOW ME FIRST

Codex makes and checks the change locally. It does not publish it. Use this for visual experiments or anything you want to approve first.

SAVE IT BUT DO NOT PUBLISH

Codex safely records the finished work in GitHub or a separate change branch, but the public website stays as it is.

MAKE IT LIVE

Codex checks the work, saves it in GitHub, publishes the exact matching version, waits for completion, and checks the real public page.

How to know it is really live

- Codex says which page was checked.
- Codex confirms the public site, not only a preview.
- Codex mentions any important link, image, phone view, or interaction it verified.
- If something prevented publishing, Codex says it is not live and gives one next step.

IMPORTANT

A saved file, a successful test, a GitHub push, or a deployment starting is not the same as a verified live update.

What happens after you say 'make it live'

You do not need to perform these steps. This page explains what Codex is checking on your behalf.

1 Understand Codex finds the right page, wording, image, or interaction.	2 Build It updates the shared site source so all affected pages stay consistent.	3 Check It tests the site and inspects phone and computer views when needed.	4 Publish It protects other work, saves in GitHub, deploys the exact version, and checks public pages.
---	---	---	---

If someone else changed the site too

Codex checks the latest shared version before publishing. Routine overlaps are combined internally. It will only interrupt you when two versions represent a real choice.

WHAT A REAL CHOICE SOUNDS LIKE

Someone else changed the same event description. I kept both versions safe. Should the live page use the shorter wording or the more detailed wording?

What Codex will not do

- Erase another person's unknown work.
- Force the shared history to accept an outdated version.
- Publish an event fact it had to guess.
- Call the job complete before checking the public result.

GitHub in plain English

GitHub is the shared history of the website. You can let Codex operate it for normal edits.

Repository - the shared project containing the website and its history.

Commit - a named checkpoint describing one finished change.

Push - sending that checkpoint to the shared GitHub copy.

Branch - a safe side copy used when work needs to stay separate temporarily.

Conflict - two people changed the same area and Codex must combine or compare the results.

Main - the shared line of finished work used for releases.

WHAT YOU CAN SAY INSTEAD

Save this change safely and make it live. Do not overwrite anything Matia is working on.

Useful status questions

- "Is my change saved in GitHub?"
- "Is it live on the public website?"
- "Did anyone else change the same area?"
- "What is ready, and what is still waiting?"
- "Can you undo only the change we just made?"

You do not need to choose Git commands or decide how to combine routine changes. If Codex asks you about a branch, rebase, merge, or force push without explaining the visible choice, ask it to restate the question in plain English.

Approvals, mistakes, and undo

Most approval windows are Codex asking permission to complete something you requested on your computer or account.

Usually normal for a website update

- Reading and changing files in this repository.
- Running the site's checks.
- Connecting the repository's client skill pack.
- Sending an approved change to GitHub.
- Publishing through the existing Sites project.

Stop and ask Matia first

- Repository or Sites ownership changes.
- DNS or domain changes.
- Billing or paid-service changes.
- Deleting a large amount of content or media.
- Requests for passwords, private keys, payment details, or one-time login codes.

UNDO A CHANGE

Say: Undo only the change we just made, keep everyone else's work, check it, and make the corrected version live.

WHEN SOMETHING LOOKS WRONG

Say which page you are viewing, whether it is on phone or computer, what you expected, and what you see instead. A screenshot is ideal.

Your quick-start card

Keep this page nearby for the first few edits.

ADD AN EVENT

Add this event to the website using the details below. Ask me one question if an important fact is missing. Make it live after checking the event page, home page, and phone view.

CHANGE THE DESIGN

On [page], the [visible area] feels [crowded / flat / too boxy / hard to read]. Make it feel [desired result] while keeping the Frequency Shift look. Show me first.

REPLACE AN IMAGE

Replace the [visible image] with the attached file. Keep [the whole poster / the artist's face] visible, make it work on phones and computers, and [show me first / make it live].

CHECK PUBLICATION

Tell me whether this exact change is live. Check the public page, not only GitHub or the deployment status.

GET UNSTUCK

I do not know what the area is called. I can see [nearby words or description]. I want it to [result]. Help me narrow it down in plain English.

You cannot ruin the project by describing something imperfectly. Start with what you can see. Codex is expected to inspect, translate, ask only when necessary, and keep unsafe choices from becoming accidental live changes.

Frequency Shift website support pack / version 0.1.0
